Single pass sequencing. Bases called and trimmed with phred
0.000925 using options -trimmalt '-trim fasta. Vector identified
by cross match using options -minmatch 12 -minscore 12
Plate: 24 row. H column: 07
Seq primer: ATTAGGTACACTATAG
High quality sequence stop: 404.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          4029716 IGAL - Chicken Intestinal Lymphocyte Gallus gallus cDNA clone IGAL_24H07 5', mRNA sequence.

//orde="Organ: whole embryo; Vector: pBluescript II KS(+);
Site_1: BCORI, Site_2: Not!; This normalized library was
constructed from I million independent clones. CDNA
synthesis was initiated using an oligo(dT) primer, using
methylated C in the first strand synthesis reaction.
Following this first strand synthesis reaction.
Following this first strand synthesis reaction.
Goografic is a custom caction, double-stranded CDNA
was blunted, ligated to NotI adapters, digested with
ECORI, size-selected, and cloned into the NotI and ECORI
compatible sites of a custom modified MCS of the
pBluescript (KS+) vector. The library was normalized in 2
rounds using conditions adapted from Soares et al., PNAS
(1994) 91: 9228-9232 and Bonaldo et al., Genome Research 6
(1996): 791, except that a significantly longer
reannealing hybridization was used."

//core="Organ: small intestine; Vector: pBluescript II
//core="Organ: small intestine; Vector: pBluescript II
//site_1: BcoRI: Site_2: Not1; This normalized
library was constructed from 1 million independent clones.
cDNA synthesis was initiated using an oligo(dT) primer,
using methylated C in the first strand synthesis reaction.
Following this first strand reaction, double-stranded cDNA
was blunted, ligated to NotI adapters, digested with
ECORI, size-selected, and cloned into the NotI and ECORI
compatible sites of a custom modified MCS of the
pBluescript (KS+) vector. The library was normalized in 2
rounds using conditions adapted from Soares et al., PNAS
(1996): 791, except that a significantly longer
reannealing hybridization was used."

ABC transporter constituent of Brevibacterium lactofermentum, its encoded gene and variants, applicable in breeding Corynebacteria particularly for production of L-glutamic acid.

Claim 5; Page 30-31; 34pp; Japanese.

The present invention describes a protein (I) which can be used to construct an ATP binding cassette (ABC) transporter. ABC transporter DNAs can be used in breeding Corymebacteria particularly for production of L-glutamic acid. The present sequence represents an ORF (open reading frame) protein from the Brevibacterium lactofermentum gitbD gene, which is used in the exemplification of the present invention. (Updated on 12-SEP-2003 to standardise OS field)

Sequence 203 AA;

Also included are an antibody which binds one of the proteins, treating a patient by administering the protein, DNA or antibody (in a composition), a kit comprising first and second primers, which are the nucleic acid cited above or fragments between nucleotides 8-100 of sequence of defined in the specification, for amplifying a target the first primer is substantially complementary to the target sequence and the second primer is substantially complementary to the carget sequence of the second primer is substantially complementary to the complement of

```

```
the target sequence, and where the parts of the primers having
cubstantial complementarity define the termini of the target sequence to
be amplified, assay comprising contacting a test compound with the
cube protein, and determining whether the test compound binds to the protein
and a Streptococcus pneumoniae bacterium, where one or more genes
cubering the proteins has been rendered inactive. The proteins, nucleic
acid molecules, antibody and compositions are useful as medicaments for
treating or preventing a disease or infection due to streptococcus
contacting or preventing a disease or infection due to streptococcus
contacting or preventing a disease or infection due to streptococcus
contacting or preventing a disease or infection due to streptococcus
contacting or preventing a disease or infection due to streptococcus
contacting or preventing a disease or infection for identifying contacting and antibitotics. The methods are useful for identifying
contacting and antibitotics. The present sequence is one of the 2469 proteins
contacting the identified coding regions from the genomic sequence
continued and for this patent did not form part of the printed
specification, but was obtained in electronic format directly from WIPO

```

```
The invention relates to a protein comprising or having at least 50% identity to any of the 2469 amino acid sequences, identified in the special citication (available on a computer readable formath, or its fragment, expressed from 2469 of 2489 identified DNA coding regions from the special strain genomic sequence appearing as ABS65454. Also included are an antibody which binds one of the proteins, treating a patient by administering the protein, DNA or antibody (in a composition), a kit comprising first and second primers, which are the nucleic acid above or fragments between nucleicides 8-100 of a sequence contained within a Streptococcus nucleic acid sequence, where the first primer is substantially complementary to the target sequence of the interest is substantially complementary to the complement of the target sequence, and where the parts of the primers having substantially complementary to the complement of the target sequence or substantial complementarity define the terminio of the primers having comparising contacting a test compound with the protein, and determining whether the test compound with the protein, and determining whether the test compound binds to the protein and a Streptococcus pneumoniae bacterium, where one or more genes encoding the proteins has been rendered inactive. The proteins, nucleic acid molecules, antibody and compositions are useful for identifying a diagnostics and antibiotics. The methods are useful for identifying compared and acceptance of an antibody and compositions are useful for identifying compared sequence is one of the 2469 proteins secured. The sequence data for this patent diagnostic sand antibiotics. The methods are useful for identifying contacting or preventing or preventing or preventing or preventing or preventing or preventing or preventing or preventing or preventing or preventing or preventing or preventing or preventing or preventing or preventing or preventing or preventing or preventing or preventing or preventing or preventing or preventing or preven
                       New proteins and nucleic acid molecules from Streptococcus pneumoniae, useful as medicaments for treating or preventing a disease or infection due to streptococcus bacteria, such as pneumonia, sepsis, otitis media or
                                                                                                                                                                          Claim 1; SEQ ID NO 4138; 56pp; English.
                                                                                                                      ear infection

```
a Streptococcus pneumoniae genomic sequence, a fragment or degenerate variant of the polynuclectide or a nucleic acid sequence 95% identical to none of the polynuclectides. The S. pneumoniae polynuclectides and encoded polypeptides (ABPB1299-ABPB1674) are useful for treating or preventing S pneumoniae infections or non-systemic diseases, e.g. otitis media, which are induced or exacerbated by S. pneumoniae. These are also useful for detecting S. pneumoniae in a biological sample or diagnosing S. pneumoniae in a biological sample or diagnosing S. pneumoniae infection in a subject. The polynucleotides have antibacterial activity and are useful in gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    EDVDLLKLSTRKQRLYRKNTVGYLFQDYALIPDRTVKFNLQLAVEKHKWPEIPQVLHAVG 120

The invention relates to a protein comprising or having at least 50% identity to any of the 2469 amino acid sequences, identified in the specification (available on a computer readable formath, or its fragment, expressed from 2469 of 2489 identified DNA coding regions from the specification (available on a computer readable formath, or its fragment, expressed from 2469 of 2489 identified DNA coding regions from the Streptococcus pneumoniae type 4 strain genomic sequence appearing as ABS5654. Also included are an antibody which binds one of the proteins, Creating a patient by administering the protein. DNA or antibody (in a composition), a kit comprising first and second primers, which are the composition of the specification, for amplifying a target composition of the specification, for amplifying a target is substantial complementary to the complement of the target sequence, and where the parts of the primers having substantially complementary to the complement of the target sequence, and where the parts of the primers having substantially define the termining of the protein and determining whether the test compound with the protein, and determining whether the test compound binds to the protein and a Streptococcus pneumoniae bacterium, where one or more genes encoding the proteins has been rendered inactive. The proteins, nucleic acid molecules, and antibody and compositions are useful for identifying the proteins. The present sequence is one of the 2469 proteins expressed by the identified coding regions from the genomic sequence. Note: The sequence data for this patent did not form part of the printed sequence of the printed proteins. The present sequence is one of the 2469 proteins can fartive the sequence data for this patent did not form part of the printed sequence as fequence is one of the 2469 proteins. When the protein is the present sequence is one of the printed sequence.

The invention provides DNA sequences (AAV62201 to AAV63304) from the Streptococcus pneumoniae genome and corresponding protein sequences (AAW80605 to AAW80728). The protein sequences are classified as hypothetical, cell wall biosynthetic, external target, or minimal gene set proteins. A recombinant host containing a vector comprising any of the above nucleic acids can be used for the recombinant expression of the proteins. The invention also provides a DNA chip having arrayed on it at least 15 base pair fragment of any one or more of these DNA sequences. The DNA chip can be used methods for evaluating gene expression in S. pneumoniae and for identifying virulence genes in S. pneumoniae. Antibodies shat selectively bind to the above proteins or peptide fragments can be used to treat S. pneumoniae infection. The antibodies can also be used to detect S. pneumoniae cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 MIBINDLKKSFGVRILWQGLSHKFLPGTMTALTGASGSGKSTLLNCLGTLDKPSSGQILV 60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Streptococcus pneumoniae nucleic acid sequences - used in DNA chips for evaluating gene expression, and identification of virulence genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SR;

```
The invention relates to a protein compurising or having at least 50% identified to any of the 2469 amino acid sequences, identified in the expecification (available on a computer readable format), or its fragment, expressed from 2469 of 2489 identified DNA coding regions from the expressed from 2469 of 2489 identified DNA coding regions from the Streptococcus pneumoniae type 4 strain genomic sequence appearing as Streptococcus pneumoniae type 4 strain genomic sequence appearing as treating a patient by administering the protein, DNA or antibody (in a composition), a kit comprising first and second primers, which are the composition), a kit comprising first and second primers, which are the sequence ontained within a Streptococcus nucleic acid sequence, the first primer is substantially complementary to the target sequence and the second primer is substantially complementary to the complement of the target sequence, and where the parts of the primers sequence to the target sequence, and where the parts of the primers sequence to substantial complementary to compound with the protein, and determining whether the test compound binds to the protein and a Streptococcus pneumoniae bacterium, where one or more genes concoming the proteins has been rendered inactive. The proteins nucleic acid molecules, antibody and compositions are useful as medicaments for treating or preventing a disease or infection due to streptococcus
New proteins and nucleic acid molecules from Streptococcus pneumoniae, useful as medicaments for treating or preventing a disease or infection due to streptococcus bacteria, such as pneumonia, sepsis, otitis media or

4.
            media or ear infection. They are also useful in developing vaccines, diagnostics and antibiotics. The methods are useful for identifying immunodominant proteins. The present sequence is one of the 2469 proteins expressed by the identified coding regions from the genomic sequence. Note: The sequence data for this patent did not form part of the printed aspecification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences. (Updated on 23-OCT-2003 to standardise OS field)

The nucleic acid sequence is useful in the detection and/or amplification of nucleic acid sequence, particularly to identify Lactococcus lactis or related species. The proteins of the invention are useful for the biosynthesis or biodegradation of a composition of interest . The invention bis research in lactic bacteria, particularly useful in the production of yogurt and
variant of the polynucleotide or a nucleic acid sequence 95% identical to one of the polynucleotides. The S. pneumoniae polynucleotides and encoded polypeptides (ABP81299-ABP81674) are useful for treating or preventing S. pneumoniae infections or non-systemic diseases, e.g. otitis media, which are induced or exacerbated by S. pneumoniae. These are also useful for pneumoniae in a biological sample or disgnosing S. pneumoniae in a biological sample or disgnosing S. pneumoniae in the polynucleotides have antibacterial activity and are useful in gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               60 RGKD---LANYKSSDFFRHELGYLFQNFGLIENGSIEENLKLGLIGQKLSRSEQRLRQKQ 116

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                             174
                                                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid
                                                                                                                                                        9
                                                                                                                                                                                  9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antisense, prokaryotic essential gene, cell proliferation, drug design.

the treatment, prevention and diagnosis of medical conditions that treatment, prevention and diagnosis of medical conditions caused by publications, the discussion and diagnosis of medical conditions caused by practices. The discussed and osteonyalitis), uvoitis and endophthalmitis.

P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acceptance or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention only peptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and activity of P. acnes proteins and activity of P. acnes proteins and activity of P. acnes proteins and activity of P. acnes proteins also be used to therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            원
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated polymuclectide (ACF64415-ACF64733)

encoding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polymuclectides (RAM35524-AAM64556) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a additionally encompasses expression vectors and host cells comprising a polypeptide of the invention; animune response specific for a p. acnes polymuclectides, dathbodies and immune response specific for a p. acnes polypeptide and an isolated T cell population comprising P acnes polypeptides, or intibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polypeptide); a method and kit for detecting or determining the presence or absence of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a patient; and a method for diagnosing, preventing or treating acne ploypeptides are useful for diagnosing, preventing or treating acnes confined acid hybridisation. The vaccine composition is useful for the sequence represents a specifically oliaimed polypeptide which is predicted to be encoded by an ORP (open reading frame) contained within the P. acnes polymucleotides of the invention, Note: The sequence data for this patent did not form part of the printed specifically polypeptide accompanied by the proper patient of the printed specifically polypeptide print place of the invention of the printed specifically polypeptide.

The invention relates to an isolated mucleic acid derived from Enterococcus faecium encoding an Enterococcus faecium polypeptide having one of 10 fully defined sequences given in the (or comprising 40 composition) and the compression of the mucleic acids, its complement or sequences hybridising to it). Also included are a comprising the mucleic acid operably linked to transcription regulatory element, a cell comprising the vector and a single-stranded probe comprising the nucleic acid operably linked to transcription regulatory element, a cell comprising the vector and a single-stranded probe comprising the nucleic acid. The mucleic acids are chosen from 364 disclosed proteins. The nucleic acids is useful for Idagnosing pathological conditions regulting from E faecium bacterial infection (e.g. urinary tract infection) and for screening drugs such as agonists and antagonists. The nucleic acid is useful for recombinant production of Candida abloins nucleic acid is useful for recombinant production of Candida abloins and vaccines containing the nucleic acid are useful for preventing or treating Enterococcus faecium infections. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       'n

The invention relates to an isolated mucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibits proliferation of a cell. Also included are:

10 a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway or proliferation, or that has an activity against a biological pathway or equired for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profilling a compound, a activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   screening

to which each of the strains is present in a culture or collection of braining to a strains; or (13) identifying the target of a compound that inhibits the prolliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular prolliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for prolliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in a lectronic format directly from NIPO at

The invention relates to a protein (ABP25413-ABP30895) from group B

creptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GAS

creptococcus progenes), comprising one of 5481 sequences (S1), given in

the specification. The proteins have antibacterial and antiinflammatory

creditorial to the proteins have antibacterial and antiinflammatory

creditorial to mucleic acids encoding (I), ABM$66044-ABN71526 and

creditorial to prevention of infection or disease caused by

Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes.

Nucleic acids encoding (I) are used to detect Streptococcus in a

composition comprising (I) or a nucleic acid encoding (I), may be

creditorial and antibactic composition. The disease caused by

creditorial to prevented or treated may be meningitis. Nucleic

creditorial to prevented or treated may be meningitis. Nucleic

acid encoding (I) may be used to recombinantly produce (I) and may be

creditorial therapy. Antibodies to (I) are used for affinity

chromatography, immunoassays, and distinguishing/identifying
detecting a compound that binds to the protein

Patent No. 6342385

GENERAL INFORMATION:

TITLE OF INVENTION: MUTACIN I BIOSYNTHESIS GENES AND PROTEINS

PILE REPERENCE: UAB-17402/22

CURRENT APPLICATION WUMBER: US/09/627,376

CURRENT FILING DATE: 2001-05-30

NUMBER OF SEQ ID NOS: 17

SOFTWARE: Patentin version 3.0

SEQ ID NO 15

LENGTH: 246

TYPE: PRT

ORGANISM: Streptococcus mutans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SSGQILVEDVDLLKLSTRKQRLYRKQYTVGYLFQDYALIPDRTVKFNLQLAV-

| Sequence 541, Application US/09543681A
| Patent No. 665709
| GENERAL INFORMATION:
| APPLICANT: GRAY BRETON
| TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PROTEUS MIRABILI)
| TITLE OF INVENTION: DIAGNOSTICS AND THERAPEUTICS
| TITLE OF INVENTION: DIAGNOSTICS AND THERAPEUTICS
| TITLE REPRENCE: 2709-1002-001
| CURRENT PAPLICATION NUMBER: US 60/128,706
| PRIOR PELING DATE: 1999-04-09
| NUMBER OF SEQ ID NOS: 8344
| SEQ ID NO 5411
